### ABSTRACT

The reading clinic at the University of Virginia continues to refine its test battery every year: a new refinement involves collection of more naturalistic language samples and writing samples to add depth to the understanding of children's developing language structures. The "tell a story to get a story" protocol provides a method for new reflection as the teacher or diagnostician tells a personal narrative and then passes the story turn to the child. Twenty-five teachers enrolled in a graduate introductory reading diagnosis course were introduced to the protocol: 21 completed an assignment to try out the protocol. The protocols, oral transcriptions, and written personal narratives of 8 children (in grades K-5) were analyzed. Analysis indicated that the teachers were using neutral sub-prompts and were careful to listen to children as they told their narratives. Teachers in the class were surprised and delighted with the comparisons that could be made between the two forms of narratives. The graduate students also learned how important it is for teachers to instruct children in spelling. By placing the oral transcription next to the written narrative, teachers can see the strengths of a child's own language. The two forms show a child's ability to transfer thought from one sphere to another and the confidence s/he has in the act of writing. (Contains 7 references and 4 figures of data; an appendix contains each child's diagnostic summary, transcribed personal narratives, and written narrative.) (NKA)

**EDUCATIONAL RESOURCES INFORMATION** 

CENTER (ERIC) This document has been reproduced as received from the person or organization

> When children are brought to a university reading clinic for an assessment of their difficulties in learning to read, the standard protocol for completing the assessment includes measures of word recognition, oral and silent reading, comprehension, and fluency. In addition, some clinicians investigate stages of word knowledge (spelling) and collect writing samples. In the last decade, individual language batteries and clinical tests of such phonological skills as pseudo-word decoding and rapid automatized naming have added further information to the student case profile.

> In our clinic, which is the second oldest reading clinic in the United States, we continue to refine our test battery every year. In addition to all of the above instruments, we have become interested in collecting more naturalistic language samples and writing samples to add depth to our understanding of children's developing language structures. The work of McCabe and Peterson—the "tell a story to get a story" protocol—has provided us a method for new reflection (McCabe & Peterson, 1991; Peterson & McCabe, 1987). Basically, the technique involves the teacher or diagnostician telling her own personal narrative ("I was stung by a bee yesterday. It hurts so much. Has that ever happened to you?) and then passing the story turn to the child. The personal narrative is defined as an oral record told by the speaker of something that happened to him.

> The McCabe & Peterson language elicitation technique has been field-tested by the original researchers and extended as a means of recognizing differences in children's cultural backgrounds (McCabe, 1997). Teachers trained in this technique, for example, become aware of the value of listening to children without interruption (Abouzeid & Austin, 1996; Cazden, 1994). In addition, they grow in the understanding that the personal narratives of children from different cultural backgrounds may be different from their own (Dyson & Genishi, 1994; McCabe, 1997). The "tell a story" protocol has also been coded by speech/language therapists as a more naturalistic way to record a child's story-telling (McCabe & Rollins, 1994). McCabe and Rollins have arrived at norms for the classic storytelling expected of Western European children ages three through nine

years growing up in this country. These norms allow language clinicians to rank a child's narrative attempts against the standard.

We thought it would be interesting to add the "tell a story to get a story" protocol to our clinical battery. We wanted both an oral narrative transcription and a written language production on the same topic. In order to do this we trained graduate reading students in a beginning diagnosis course in the technique of collecting a personal narrative. We felt that an awareness of children's personal narrative differences related to their cultures would be strong clinical training. In addition, we felt that the inclusion of an oral transcription next to a writing sample would be a more naturalistic and interesting way to collect language information for cases.

Twenty-five teachers enrolled in a graduate introductory reading diagnosis course were introduced to the "tell a story to get a story" protocol at the beginning of their training. They were asked to select a child with whom they might continue working throughout the course and try out the technique. Twenty-one of twnety-five completed this assignment; eight samples are presented here. Those protocols and the children's oral transcriptions and written personal narratives form the subject of this paper. We summarized the children's diagnostic information in outline form and then compared the personal and written narratives.

The demographics of the children are as follows: two children were kindergartners, one was a first grader, three were eight-year old third graders, one was a fourth grade student, and one was in the fifth grade. Interestingly enough, all children were Western European in their ethnicity, despite the fact that the locale in which the class was taught contains a number of English as Second Language students. There were six boys and two girls who were selected by their teachers for this diagnosis assignment. One child received services from Special Education; all the rest were from Regular Education classrooms. (Please see Figure One.)

Next we looked at each child's literacy knowledge. Reading and spelling levels inform our understanding of children's writing productions. Information is summarized in Figure Two with full profiles contained in the Appendix. Four children were instructional at the preprimer (very early beginning reading) level. This included the two kindergartners, the first grader, and one of the third grade children. The three younger children of this group were Early Letter Name spellers—they used the names of letters to signify word beginnings and endings in their writing. None of these children consistently used vowels in single syllable words. The older boy did include short vowel substitutions in his writing, so he would be classified as a more advanced speller, at the full Letter Name stage.

Typically, as children's reading levels advance, their spelling progresses. The third grade girl was a Primer/First Grade reader; Matthew, in the third grade, was reading at the second grade level. Both of these children, however, were still Letter Name stage spellers. The fourth and fifth graders were reading well below their grade placement, at the second grade instructional level. They spelled most short vowel single syllable words

correctly and needed instruction in long vowel spelling patterns. These children are said to be at the Within Word Pattern stage of spelling—they are learning the vowel patterns that form long vowel pronunciations.

All children's personal narratives were elicited using the "tell a story to get a story" paradigm. Each teacher collected three narratives and chose one for analysis according to the McCabe and Rollins protocol. Although teachers' prompts are not indicated, we can infer them from the children's stories. Three stories involved personal injury. They included trips to the hospital, getting shots, falling off bikes, and having Xrays. Two were about fishing expeditions. One of those did not get beyond a listing of who caught what. But one little boy elaborated his story by telling how the man came to check his dad's fishing license so they went to McDonalds! Two boys described personal challenges involving catching a scary spider and learning how to ride a four-wheeler. Finally, Sam told the story of a bully.

In every case, the elicitation procedure as transcribed indicated that teachers were using neutral sub-prompts and were careful to listen to children as they told their narratives. (Transcriptions for each child are contained in the Appendix.) We had tried to warn the teachers about the dangers of interrupting or of leading children from their story by interspersed questions. In a former attempt of this sort, we had considerable difficulty with teachers interrupting children's narratives (Abouzeid, Rosemary, and Austin, 1995). This appears to be crucial training if the narrative is to be part of our diagnostic procedure.

Next, we examined the children's written narratives and compared them to oral narratives (See Figures Three and Four). The three youngest children, Luke, Jessica, and Bud, drew pictures for their written narratives. For children this age, pictures are often the means of expression. The pictures illustrated the personal narrative they had just told. One, Jessica's, was more elaborate than the others—she created a three panel drawing complete with invented spelling, closely retelling her orally told story. Luke's drawing was two tadpole figures, legs and arms akimbo, depicting himself with his father trying to pull his tooth! This was the most immature writing and drawing of the group. He did use some letters but there appeared to be no letter-sound correspondence to his caption. Bud drew a spider in a web—the BIG spider that scared and taunted him in his personal narrative. The letters accompanying it were SIT.

Three children, Megan, Matthew, and Shawn, wrote long and detailed narratives that mirrored almost to the word their oral narratives. Each wrote a notebook page. All the children appeared intent on writing but their spelling hampered their ability to share their thoughts as fully as they had done orally. Shawn used the connectors "and then..." to connect eight events. His written narrative was probably more truthful than his oral one—in the oral narrative about the game warden coming to check fishing licenses, he had spent some time telling the listener that he had caught the biggest fish. In the written version, everyone caught big fish!

Finally, Derick and Sam wrote the shortest narratives. Derick's personal narrative was about fishing—but there was no high point, no resolution of a problem, no conclusion—just a listing of everyone catching fish! His written story followed the same pattern. He generated four lines ("me and mie [my] bad [dad]") with so many problems with spelling and letter reversals that writing must have been painful. The contrast lies in the comparison of his oral transcription with the written one. He was able to generate many ideas orally. But in writing, his problems become apparent. Derick is a third grader who is reading on a preprimer level. Sam, on the other hand, is a fifth grader who is receiving LD services. Sam is reading two to three years below his grade placement. His personal narrative was about a bully who hit him in art class and what happened after. He adds a moral to his story, "From now on, I'm staying away from him." His writing was cohesive and more to the point than his oral narrative. He was able to write his story in two sentences, four lines of paper, connecting his thoughts together with "and's" and "so". His written form was concise and to the point.

Teachers in the class were surprised and delighted with the comparisons that could be made between the two forms of narratives. They felt that while the oral narratives allowed the child to give more detail, it also allowed them to "prewrite" their written narrative. They thought that the children's ideas "flowed" more readily in writing after the oral narrative. They made note of the pauses that were evident in oral narratives—pauses that signaled a child's thinking. These pauses don't show in written formats. They also learned to let the child give the story. This takes patience and practice but yields good results. For example, Jessica had a difficult time structuring her personal narrative but her written form was creative and energetic—she tried lots of invented spelling and did picture captions as well. The teacher listening to Jessica's stories learned a lot about this little girl.

The graduate students also learned how important it is for teachers to instruct children in spelling. When children get a handle on letter sound associations, they have the power to communicate their thoughts in writing. Jessica, a kindergartener, was able to communicate through her writing using invented spellings. Derick, the third grader not yet identified for special services in his school, shows very clearly in his writing that he is in desperate need of appropriate instruction. For Derick, working in third grade reading material and spelling third grade words is completely misplaced instruction. If we look more closely at his diagnostic profile, we can see that his phonological awareness skills were below those of a first grade child. Derick is in need of intervention immediately. A teacher paying attention to the barometer of development—writing—would have seen that much earlier. And Sam, who was receiving intervention services, had gained enough control of his writing that by fifth grade, his written narrative expressed a personal experience with a bully, his reaction, and a moral in well-designed sentences. Sam's oral narrative served as a springboard for his writing and his writing benefited from the rehearsal.

A heightened sensitivity to children's personal narratives would appear to hold many possibilities for the teacher/clinician. By placing the oral transcription next to the written narrative, teachers can see the strengths of a child's own language. The two forms show

a child's ability to transfer thought from one sphere to another and the confidence s/he has in the act of writing. The inclusion of the transcribed oral narrative in Derick's case profile, for example, allows the teacher/clinician to consider using his strength in his remediation. Derick can be encouraged to participate in the exchange of personal narratives with his teacher. Those can be transcribed into material Derick can read. In addition, the teacher can point out the letter sound correspondences he needs to learn—the association between the letter B, the sound /b/ with lots of words that match that beginning sound, etc. Derick can learn to use his expert oral voice to support his burgeoning written one. The same can hold true of children whose language development is delayed. By learning to write, these children can "hold onto" language on the page like they cannot do in their heads.

Contrasts such as these and others will continue to emerge as we continue to collect these narratives and address them in our weekly clinical staffings. It is our hope that future reading specialists trained by us will become attuned to the diversity of all children, their cultural differences as well as the differences that develop in children's oral and written language related to past instruction.

### My Tooth.

One time, when at this hotel my tooth was really loose... and my, my dad tried to pull it out, with a wash cloth, but it didn't come out. And... so we waited until we got home. We waited until a few weeks... a few weeks... and then it came out! And he did magic! It wasn't in the paper towel, but this was at home, it was in my ear! He's good at magic! He just pulled it out-POP! And then he, then he just pulled it out... I was like ALRIGHT! When and..... I, when I was outside and when I put my tongue in there (points to hole between teeth) it tastes kinda salty... because the blood makes salt when the... tooth comes out! (said in a whisper)

### I. DOCUMENT IDENTIFICATION:

Title: Using Personal Narratives During Diagnisis: Chinical Revelations

Author(s): Abouteid, Nary P. and Kathleen Burgess

Corporate Source: UNIVERSITY OF VIREGIMA

Publication Date: DEC. 98

### II. REPRODUCTION RELEASE:

In order to disseminate as widely as possible timely and significant materials of interest to the educational community, documents announced in the monthly abstract journal of the ERIC system, Resources in Education (RIE), are usually made available to users in microfiche, reproduced paper copy, and electronic media, and sold through the ERIC Document Reproduction Service (EDRS). Credit is given to the source of each document, and, if reproduction release is granted, one of the following notices is affixed to the document.

If permission is granted to reproduce and disseminate the identified document, please CHECK ONE of the following three options and sign in the indicated space following.

The sample sticker shown below will be affixed to The sample sticker shown below will be affixed to all Level 2A The sample sticker shown below documents 2B docum all Level 1 documents

Level 2A

Level

X

Check here for Level 1 release, permitting reproduction and dissemination in microfiche or other ERIC archival media (e.g. electronic) and paper copy.

Check here for Level 2A release, permitting reproduction and dissemination in microfiche and in electronic media for ERIC archival collection subscribers only

Check here for Level 2B release dissemination in m

Documents will be processed as indicated provided reproduction quality permits. If permission to reproduce is granted, but no box is checked, documents will be processed at Level 1.

I hereby grant to the Educational Resources Information Center (ERIC) nonexclusive permission to reproduce and disseminate this document as indicated above. Reproduction from the ERIC microfiche, or electronic media by persons other than ERIC employees and its system contractors requires permission from the copyright holder. Exception is made for non-profit reproduction by libraries and other service agencies to satisfy information needs of educators in response to discrete inquiries.

### III. DOCUMENT AVAILABILITY INFORMATION (FROM NON-ERIC SOURCE):

If permission to reproduce is not granted to ERIC, or, if you wish ERIC to cite the availability of the document from another source, please provide the following information regarding the availability of the document. (ERIC will not announce a document unless it is publicly available, and a dependable source can be specified. Contributors should also be aware that ERIC selection criteria are significantly more stringent for documents that cannot be made available through EDRS.)
